

KANOE.AI

The Operating System for Travel

Global travel technology is a \$2.1 trillion industry still running on infrastructure built in the 1990s. Kanoe.ai replaces it.

While fintech, logistics, and e-commerce rebuilt the user experience from the ground up, travel tech stagnated. Today, over 90% of travel operators, including OTAs, ITAs, and DMCs, manage bookings through fragmented systems, settle payments manually, and serve clients with interfaces that have barely changed in two decades.

The result: chronic inefficiency, margin leakage, and an industry unable to deliver the personalised, real-time experience that modern travellers expect.

THE PLATFORM

Kanoe.ai is an AI-first, crypto-native infrastructure layer for the B2B and D2C travel market, consolidating booking, itinerary management, operations, payments, and analytics into a single deployable platform. Operators go live in days, not months, with no technical client expertise required.

Inventory is unified across Amadeus, Sabre, Expedia, Booking.com, Travelport and others through a single API layer, giving operators access to the world's travel content from one interface.

FIVE DEFENSIBLE DIFFERENTIATORS

Kanoe is not a feature improvement on existing travel tools; it is an AI and blockchain-driven redesign of the whole travel booking, processing and payments experience. Each of the five pillars below represents a structural capability that no incumbent or direct competitor currently offers in combination.

01 Avatar LLM Interface

Coded-Parameter AI GUI

Kanoe's avatar-driven LLM interface replaces the traditional search-and-click GUI with a conversational AI front-end ("Sasha", "Juan", "Tyler", "Anna"), each persona scoped to its operator context with hard-coded parameter guardrails. Clients interact naturally. The platform enforces business rules invisibly. No comparable B2B travel platform has shipped this capability.

02 Itinerary Creation & Booking Engine

End-to-End Dynamic Booking

A unified booking engine aggregating live inventory from Amadeus, HotelsPro, and Travolutionary, generating fully-formed, personalised itineraries from a single conversational prompt and enabling one-click checkout. Eliminates the 6-12 manual touchpoints typical in an OTA, ITA or DMC workflow.

03 Crypto-Native Architecture

Stablecoin Settlements & Crypto Rails

Kanoe is built payment-rail-agnostic from the ground up, with native stablecoin settlement capability baked into the transaction layer, not bolted on. This virtually eliminates the 30-60 day settlement lag that costs OTAs working capital and opens the platform to a generation of operators and travellers who transact on-chain.

04 Advanced Data Analytics

Behavioral Intelligence & Data Licensing

Every booking, preference signal, and search interaction flows into a real-time analytics layer generating operator dashboards, predictive pricing, and forecasting models. Aggregated and anonymised, this behavioural dataset becomes a licensable alternative data product; a second revenue stream that compounds with platform scale.

05 Agentic AI Operations

Autonomous Ops & Customer Care

Beyond booking creation, Kanoe's agentic layer handles post-booking operations autonomously: itinerary amendments, supplier communications, customer care escalations, and admin workflows. Operators gain the leverage of an enterprise back-office without the headcount. The platform acts, not just recommends.

BUSINESS MODEL

A hybrid revenue architecture that captures value at every layer of the platform:

- **B2B Platform:** White-label SaaS subscriptions and SDKs for SME travel operators. Recurring, scalable, low-churn.
- **D2C/B2B Properties:** Kanoe-owned niche OTAs running on the same infrastructure. High-margin direct consumer revenue.
- **Network Revenue:** Transaction commissions, aggregated alternative data licensing, and proprietary IP.

Target raise

A working MVP has been validated on Inisoft, v3 UI complete, TRL 6. The platform's four AI agent personas - Sasha (OTA), Juan (ITA Advisor), Taylor (DMC Ops), and Anna (Platform Admin) - demonstrate the full operator workflow end-to-end with live inventory connections.

T E A M

- **Jon Peters, CEO** Founder and product architect with domain expertise across travel tech, data tech and platform strategy.
- **Tyler Warren, CSO** Co-Founder and Commercial strategy and market development.
- **Josh Rosenthal CTO** Platform engineering and AI infrastructure.
- **Gaston Tchecourel CPO** Product vision, strategy, and product team leader.
